

COMPOSITIONS AND METHODS FOR TREATING OR PREVENTING PNEUMOCOCCAL INFECTION

Abstract

The invention provides polypeptides, polysaccharide-polypeptide conjugates, and
5 expression vectors for treating or preventing pneumococcal infection. The compositions
induce an anti-pneumococcal immune response when administered to a mammal. The
compositions can be used prophylactically to vaccinate an individual and/or therapeutically
to induce a therapeutic immune response in an infected individual.
